

Publishing Blog Posts on vektor10.com

< [A GUIDE FOR TODD](#) · [NO CODE REQUIRED](#) >

The big picture

There is no blog dashboard and no CMS login — and that is on purpose. Every blog post is just a **text file** that lives in our GitHub repository. When you add or edit one of these files, the website **rebuilds and republishes itself automatically** within about two minutes. The blog index page, the post page, the social-share previews, and the SEO markup are all generated for you from that one file.

So the entire job is: **1)** write your post in a file, **2)** put it in the right folder on GitHub, **3)** save. That's it.

Where posts live

`github.com/treypreisel/Vektor10`

- `src/content/blog/` ← one .md file per post (the words)
- `public/blog/` ← the images your posts use

The file name becomes the web address. A file named `why-feeds-matter.md` publishes at `vektor10.com/blog/why-feeds-matter`. Use lowercase words separated by hyphens, no spaces or punctuation.

Step by step: adding a post from your browser

1. Go to `github.com/treypreisel/Vektor10` and log in.
2. Navigate into `src/content/blog/`.
3. Click **Add file** → **Create new file** (top right).
4. Name it: your post's URL slug plus `.md` — e.g. `the-new-shelf.md`.
5. Paste the template from the last page of this guide and replace its contents with your post.
6. Click **Commit changes...** (green button), then **Commit changes** again in the popup. Leave "Commit directly to the main branch" selected.
7. Wait ~2 minutes, then check `vektor10.com/blog`. Your post is live.

Editing works the same way: open the file on GitHub, click the pencil icon, change the text, commit. The site republishes automatically every time.

Anatomy of a post file

Every post has two parts: a **header block** between two `---` lines (information *about* the post), followed by the **body** (the post itself, in plain text). Here is the header from your eMarketer post:

```
---
title: "eMarketer says OpenAI misses its $100 billion ad target. I'll take that bet."
description: "ChatGPT's first ad cards look weak - no price, no button, no
  reviews. So did Amazon's. The floor is the story."
date: 2026-06-09
readTime: 9 min read
heroImage: /blog/emarketer-chart.png
heroAlt: "eMarketer's OpenAI ad revenue forecast, 2026-2030"
canonical: https://www.linkedin.com/pulse/...
---
```

Field	Required?	What it does
title	Yes	The headline. Shows on the blog page, the post, Google, and link previews.
description	Yes	One or two sentences. This is what Google and iMessage/Slack previews show under the title - write it like a hook, not a summary.
date	Yes	Publish date as YYYY-MM-DD. Controls ordering; newest post becomes the big featured card on the blog page.
readTime	No	e.g. "7 min read". Rough rule: your word count / 250. Defaults to "5 min read".
heroImage	No	The cover image - its address inside the site, e.g. /blog/my-chart.png. Used at the top of the post, on the blog index card, and as the link-preview image.
heroAlt	No	One line describing the image. Doubles as the caption under it and helps SEO/accessibility.
canonical	No	If the post first appeared on LinkedIn, paste that URL here. Tells Google "the original lives there" so we are not penalized for duplicate content.
author / role	No	Already default to you. Only add these if someone else writes a post.

Two gotchas: keep the quotes around title/description if they contain a colon or apostrophe (when in doubt, just always use quotes), and keep the date format exactly YYYY-MM-DD.

Writing the body (formatting cheat sheet)

The body is plain text with a few simple symbols, called Markdown. The site translates each one into our house style automatically — you never pick fonts, sizes, or colors. What you type on the left renders as described on the right:

You type...	The site renders...
A blank line between paragraphs	Normal paragraph spacing. (A single line break is NOT a new paragraph - leave an empty line.)
## The New Shelf	A section heading in our display font. Use these to break up long posts. Always two # symbols.
bold words	Bold, slightly darker ink - good for the punchline of a paragraph.
<i>*italic words*</i>	Italics.
> A line starting with >	A pull quote: large teal display text with a vertical rule - the signature look from your eMarketer post ("I read it the other way").
- item one (each on its own line)	A bulleted list.
[anchor text](https://example.com)	A link. The words in [brackets] are clickable; the address goes in (parentheses).
![chart](/blog/my-chart.png)	An image, full column width, with the site's card border and shadow.
<i>*ChatGPT Ad Example*</i>	SPECIAL: an italic line alone in its own paragraph right after an image becomes a small centered caption under it.

Images

1. On GitHub, go to `public/blog/` and click **Add file → Upload files**. Drag your image in and commit.
2. Give it a simple lowercase name first, e.g. `shelf-chart.png` — the name is part of its address.
3. Reference it from your post as `/blog/shelf-chart.png` — either as the heroImage in the header, or in the body with `![description](/blog/shelf-chart.png)`.
4. For an in-body caption, put an italic line directly under the image (see the cheat sheet above).

Wide images look best (roughly 2:1, at least 1200px across) - the hero spans the full article width.

If something looks wrong

Post isn't showing up after ~5 minutes. Usually a header typo - a missing quote or a malformed date stops the whole site from rebuilding (your post will not half-publish; nothing changes until the file is valid). Open the file, compare against the template, fix, commit again.

Image is a broken square. The address doesn't match the file. Check the file is in `public/blog/` and that the path in your post starts with `/blog/` and matches the name exactly, including `.png` vs `.jpg`.

Pull quote / heading isn't styled. The `>` or `##` needs to start its own paragraph - blank line before and after.

Anything else. Nothing you commit can break the layout or other pages - worst case the site simply keeps showing the previous version. Ping Trey and it's a quick fix.

Copy-paste template for every new post

```
---
title: "Your headline here"
description: "The one-sentence hook that shows up in Google and link previews."
date: 2026-06-20
readTime: 6 min read
heroImage: /blog/your-cover-image.png
heroAlt: "One line describing the cover image"
---
```

Your opening paragraph.

A Section Heading

More paragraphs. **Bold the line that matters.**

> A pull quote that deserves the big teal treatment.

![A chart worth a thousand words](/blog/your-inline-image.png)

Caption for the image above

Closing paragraph.
